Indoor Unit Operation & Installation Manual

MVAB009MV2AA
MVAB012MV2AA
MVAB018MV2AA

No. 0150524454

• Please read this manual carefully before using.
• Keep this operation manual for future reference.

Original instructions
Your air conditioner may be subject to any change owing to the improvement of Haier products.

MRV series multiple air conditioning systems adopt the consistent running mode, by which, all indoor units can only be heating or refrigerating operation at the same time.

To protect the compressor, the air conditioning unit should be powered on for over 12 hours before using it.

All indoor units of the same refrigerating system should use the unified power switch to ensure that all indoor units are in the state of being powered on at the same time during the operation of air conditioner.

Product Features:
1. Hanging-style installation to save space;
2. Automatic display of faults;
3. Central control function; (optional from our company).
4. If there is a power outage while the system is operating, the system will resume the last mode and settings it was set to run in.
5. This indoor unit ships with wireless controller. It is compatible with both YR-E17 and YR-E16 wired controllers.

Warning
• If the supply cord is damaged, it must be replaced by the manufacturer, its service agent or similarly qualified persons in order to avoid a hazard.
• This equipment should not be used or serviced by personnel who have not been properly trained in its operation and maintenance.
• Children should be supervised to ensure that they do not play with the appliance.
• The appliances are not intended to be operated by means of an external timer or separate remote-control system.
• Keep the appliance and its cord out of reach of children.

Parts and Functions

Indoor unit

Outlet guide plate
(empty)
(air direction can be adjusted by using direction adjustment key on the remote controller)

electrical cabinet

Air-inlet grille

Air filter (inside air-inlet grille)
Safety

- This manual should be saved and stored close to this air conditioning equipment.
- There are two types if indications. Both are related to safety and should be strictly followed. "⚠️ Warning" highlights issues that pose a risk of major injury or death. "⚠️ Caution" highlights issues that pose a risk of equipment or bodily injury.
- After installation and start-up commissioning, please give the manual to the user. The manual should be kept in safe place and close to the unit.

⚠️ WARNING

- Installation and maintenance should be performed by an authorized agency. The wrong operation of this air condition equipment may cause water damage, electric shock or fire.
- Please install the unit on the top of a solid foundation or structure which is strong enough to support the unit.
- The installation of this condition equipment should follow local building codes.
- Use the right cable size, secure the terminal firmly, organize the cables well and make sure no tension is added on cables. Cable insulation should not be damaged. Improper wire installation may lead to fire.
- This unit is only compatible with R-410A refrigerant. If any other gas enters the system, it may lead to abnormal high pressure which may cause damage or injury.
- Only use branches supplied by Haier. Use of any other branches will void warranty.
- Keep the condensate drain pipe away from toxic gas vents to prevent possible pollution of indoor environment.
- Care should be taken to ensure that there are no refrigerant leaks. R-410A is a heavy gas and will displace oxygen. Ventilate the area if a leak if found.
- The unit is not explosion-proof. Please keep it away from flammable gases.
- The drain pipe should be installed per this manual to ensure proper drainage. The pipe should be well insulated to avoid condensation. Wrong installation may lead to water damage.
- Both liquid pipe and the vapor pipe should be also well insulated. Not enough insulation may lead to system performance deterioration or condensate formation.
- This equipment should not be used or serviced by personnel who have not been properly trained in its operation and maintenance.
- Children should be supervised to ensure that they do not play on or near the equipment.
- Keep the appliance and its cord out of reach of children.
- The appliances are not intended to be operated by means of an external timer or separate remote-control system.

⚠️ CAUTION

- Grounding wire should be connected to the grounding bar. The grounding wire cannot be connected to the gas pipe, water pipe, lightening rod or the telephone grounding wire. Improper grounding may cause electric shock.
- A circuit breaker should be installed. If not, it may cause electric shocks or accidents.
- After installation, the air condition equipment should be powered on and passed the electric leakage current lest.
- If the ambient humidity is more than 80%, if the water discharge hole is blocked or the filter becomes dirty or the airflow speed changes, this may lead to condensate water leaks. There may also be some drops of water spraying out.
## Safety

### Attention

| • Do not put any heating apparatus under the indoor units. The heat may cause distortion of the units. | • 3-minutes protection
To protect the unit, there is a 3-minute time-out after the unit stops or after power is applied. |

</tbody>
</table>
Filter Maintenance:
Clean the air filter & air inlet grid.
• Don’t remove the air filter except for cleaning, or faults may occur.
• When the air conditioner operates in the environment with too much dust, clean the air conditioner more times (generally once every two weeks).

1. Remove the air inlet grid as shown below: press on the two locks on the grid (as shown in Fig. 1), gently lift it at a 45 degree angle (as shown in Fig. 2), and then remove the air inlet grid.

2. Dismantle the filter: press the outer frame of the air inlet grid, and draw the base angle of the filter pull it out as to disengage the locks, and remove the filter (as shown in Fig. 3).

   ![Fig. 1](image1)
   ![Fig. 2](image2)
   ![Fig. 3](image3)

Cleaning Air Cleaner
Clean the air filter with a vacuum or water to remove dust.
For heavy dust, use the vacuum or directly spray mild soap on the air inlet grid, and then clean it with water after soaking for ~10 minutes.
(A) remove dust with dust collector.

   ![A](image4)

(B) for heavy dust, use a soft brush and mild detergent to clean.
(C) rinse off water/soap and dry in a cool place.

   ![B](image5)

   ![C](image6)

Attention
• Do not clean it with hot water 122°F(50°C) to avoid fading or distortion.
Installing air cleaner and air inlet grid:
1. Mounting the filter: opposite of dismantling the filter (as shown in Fig. 3 above).
2. Mounting the air inlet grid: as shown in the right figure, clip the locks on the grid as directed by the arrows, put the side with the hinges into the lock port, and then put the side with locks into the panel frame. Release the locks to position the grid after determining that the grid is flush with the bottom of the panel frame.

Cleaning the air outlet port and the shell:

**Attention**
- Do not use gasoline, benzene, diluents, polishing powder or liquid insecticide to clean them.
- Do not clean them with hot water of over 122°F(50°C) to avoid fading or distorting.

- Wipe them with a soft dry cloth.
- Water or neutral dry cleaner is recommended if the dust cannot be removed.

Cleaning Louvers:
- To avoid damage to the louvers care should be taken when cleaning. Use damp cloth and mild detergent.
Please check the following when consigning repair service:

<table>
<thead>
<tr>
<th>Symptoms</th>
<th>Reasons</th>
</tr>
</thead>
<tbody>
<tr>
<td>Water flow sound</td>
<td>Water flow sound can be heard during starting operation, during operation or immediately after stopping operation. When it starts for 2-3 minutes, the sound may become louder, which is the flowing sound of refrigerant or the draining sound of condensate water.</td>
</tr>
<tr>
<td>Cracking sound</td>
<td>During operation, the air conditioner may make a crackling sound, which is caused from the temperature changes of the heat exchanger.</td>
</tr>
<tr>
<td>Terrible smell in outlet air</td>
<td>The terrible smell may be caused from walls, carpet, furniture, clothing, cigarette and cosmetics, that attach to the air conditioner.</td>
</tr>
<tr>
<td>Flashing operating indicator</td>
<td>When switching it on again after power failure, turning on the manual power switch will show the operating indicator flashes.</td>
</tr>
<tr>
<td>Awaiting indication</td>
<td>It displays the waiting indication as it fails to perform refrigerating operation while other indoor units are in heating operation. When the operator set it to the cooling or heating mode and the operation is opposite to the setting, it displays the waiting indication.</td>
</tr>
<tr>
<td>Idle indoor unit still has sound of refrigerant flowing and radiating temperatures.</td>
<td>To prevent oil and refrigerant from blocking the valve of idle units (off or satisfied) while other indoor units are operating, some refrigerant flow is allowed to pass through. This may result in some radiating temperature and flow noise.</td>
</tr>
<tr>
<td>Bad cooling &amp; heating effects</td>
<td>Check if air intake port and air outlet port of outdoor units are blocked. Check if the door and windows are open. Check if the air filter is blocked with sludge or dust. Check if the setting of fan speed is set to low speed. Check if the setting in in Fan Operation state. Check if the temperature setting is correct.</td>
</tr>
</tbody>
</table>

**Under the following circumstances, immediately stop the operation, disconnect the manual supply switch and contact the after-service personnel.**

- When buttons are inflexible actuated;
- When fuse and breaker have been burnt over and over;
- When there are foreign objects or ice in the unit;
- When system won't run after resetting power and waiting for 3-minute time out;
- When other abnormal conditions occur.
Installation Procedures

Caution:
Choose a suitable installation location.
Avoid places with high salinity (salt water) and high sulfur gas. Unit will corrode and damage will not be covered by warranty.
Avoid excess oil (including mechanical oil) and steam. This can reduce efficiencies and product performance.
Avoid areas where machines generate high frequency electromagnetic waves. They can cause control issues.

Warning:
Protect the machine from winds or earthquake, install according to regulations. Improper installation will cause accidents due to unit coming loose and falling.

Select the following places to install indoor units.
(1) where there is enough room for the machine above the ceiling;
(2) where the drainpipes can be well positioned;
(3) where the distance between the air outlet port of the machine and the floor is not more than 8.86ft(2.7m);
(4) where air inlet & outlet of the indoor units are not blocked;
(5) where it is sturdy enough to bear the weight of the unit;
(6) where there are no televisions, pianos or other valuables under the indoor units as to avoid condensate dropping down, causing damage.
(7) Where it is over 3.28ft(1m) away from the television and radio as to avoid the interference from television and radio.

Required Tools for Installation
- Brazing torch
- 15% silver phosphorous copper brazing alloy
- Wire stripper
- Soap-and-water solution or gas leakage detector
- Torque wrench
- 17mm, 22mm, 26mm
- Tubing cutter
- Reaming tool
- Flaring tool
- Razor knife
- Measuring tape
- Level
- Vacuum pump
- Micron gauge
- Nitrogen
- Mini-Split AD-87 Adapter (1/4” to 5/16”)
- Non-adhesive Tape
- Adhesive Tape
- Electrical wiring

Installation Space
Ensure the required space for installation and maintenance (refer to the following drawings).
The installation height should be kept within 8.86ft(2.7m).
When the height of the ceiling exceeds 8.86ft(2.7m), the warm air is harder to blow to the ground.
Installation Procedures

Note:
Before suspending the indoor unit, select an installation location according to the piping and wiring in the ceiling, and determine the direction of the piping. Prepare all pipes (refrigeration and drainage) and wiring (power supply, communication and control) to be ready to connect once unit is installed.

Hanging Unit
1. Use cardboard template to locate desired location. Mark the mounting positions of the threaded rods using the guides on the cardboard template.
2. Install 3/8in threaded rods to structure using appropriate fasteners.
3. Add nuts and washers at approximate height.
4. Lift the cassette and position the threaded rods into the 4 mounting clips on each corner of the cassette unit.
5. Adjust the height of the unit so that bottom surface is recessed 1 inch from ceiling surface.
6. Using a level, adjust the nuts on the threaded rods to obtain a level reading across the bottom of the cassette unit.
7. Tighten the top nuts to lock unit into place. An additional nut on top and bottom of bracket may be added to jam against the installation nuts to prevent them from loosening due to unit vibration.

Tighten the nut on the washer.

- Check if the indoor unit is level with the water level and that the polythene tube drains with water. Check if the size of the ceiling hole is correct. Remove any water before mounting the decorated board.
- Fasten the screws to make the height difference between the two sides of the indoor unit less than 0.2in(5mm).
Installation Procedures

Requirements:
• The drainpipe of the indoor unit should be insulated.
• Maintain a downward slope. Avoid waves or dips.
• The horizon length of the drainpipe should be kept with 65.6ft (20m). Under the condition of long pipes, supports can be provided every 4.9-6.6ft (1.5~2m) as to avoid unevenness.
• The central piping should be connected according the following drawing.
• Take care not to apply external force on the connection of the drainpipes.

![Diagram showing support bracket and downslope with no waves or dips.]
Pipe should drop 3.9in (10cm)
4.9-6.6ft (1.5m~2m) support bracket
Heat insulating material
No waves or dips
down gradient over 1/100
VP30

<th>1-1/4 inch sch. 40 PVC</th>
</tr>
</thead>
<tbody>
<tr>
<td>Insulating Material</td>
<td>1/4 inch thick Polyethylene wrap</td>
</tr>
</tbody>
</table>

Drain Hose
Attach the soft end of the drain hose to the drain port with clamp. The hard end is 1-1/4 PVC. Use glue to attach condensate drain line.

Insulation Wrap:
• All exposed drain pipe needs to be insulated to prevent condensation buildup and possible water damage.

Lifting Drainpipe
The drainpipe can be maximally lifted 24in (360mm) to provide adequate slope to drain water.

![Diagram showing lifting drainpipe with eccentricity adjustment max. 0.78in (20mm) and 45° bending (max.).]
Installation Procedures

Drain Test
Test the drainpipe to confirm that there are no leaks or other issues with the drainpipe.

- After system is fully installed and power is applied, turn on cooling operation and add water to check for drainage.
- Confirm sound from the motor of the drainage pump and check for proper drainage.

Tubing Permissible Length & Height Difference
Please refer to the Haier MRV selection software.

Tubing Materials & Specifications
Please refer to the manual of the outdoor unit.

<table>
<thead>
<tr>
<th>Model</th>

<tr>
<td>Liquid pipe</td>
<td>Ø1/4&quot;(Ø6.35)</td>
</tr>
<tr>
<td>Tubing Material</td>
<td>R-410a rated copper tubing</td>
</tr>
</tbody>
</table>

Additional Refrigerant Charge
Add refrigerant according to the installation manual of outdoor unit. The addition of R410A refrigerant must be performed with a digital scale to ensure the specified amount is added. Not following this can potentially cause efficiency issues or compressor failure.

Connecting Procedures of Refrigerant Tubing
Connect all the refrigerant tubes via flare connections.
- Dual wrenches must be used in the connection of indoor unit tubing.
- For tightening torque refer to the right table.

<table>
<thead>
<tr>
<th>Outer Diameter of Tubing in (mm)</th>
<th>Mounting Torque lb-in(N-m)</th>
<th>Flare Torque Spec ft-lb (N-m)</th>
</tr>
</thead>
<tbody>

<td>216.8(24.5)</td>
<td>30 (40)</td>
</tr>
<tr>
<td>Ø1/2&quot;(Ø12.7)</td>
<td>443.7(49.0)</td>
<td>43 (59)</td>
</tr>
</tbody>
</table>

 Cutting and Enlarging
- Cut the tube to the needed length.
- Ream the cut to remove shoulder. Do this with the tube facing down to help fillings fall out.
- Add supplied flare nut to tube.
- Use 45° flare tool to create flare.

Wire Connections

1. Connecting using circular crimp terminals:
   The method of using circular terminal is shown in the figure. Take off the screw, connect it to the terminal after placing it through the ring at the end of the lead and tighten it down.

2. Connecting using straight terminals:
   The method of using straight terminals is shown as follows: loosen the screw before putting the wire into the terminal block, tighten the screw and confirm it has been tightened by pulling the line gently.

3. Clamp the wires:
   Secure the wires with clips which should press on the insulation of the wires.
Installing the decorated panel on the body of indoor unit:

- Prior to attaching the panel to the unit locate the louver motor connector on the panel and the unit. Orientate the panel so they can connect.
- First temporarily position it with screws.
- Tighten each screw a little at a time to allow the panel to seat flush against the unit.
- If the foam gasket does not seal against the unit then lower the body of the indoor unit.
- Wiring of panel:
  Connect both connections for the display and louver motors.

Attention

If the panel does not seal against the unit then leaking air could cause moisture to condense on ceiling surfaces and cause water damage.

Unit must be level to prevent water from leaking from the condensate pan.

Table:

Fig.2
Electrical Wiring

⚠️ WARNING

- Follow local codes when selecting wire gauge and connecting to house power.
- Use the cable strain relief clips and locking conduit clamps to prevent wires from being pulled off terminal posts.
- Unit must be properly grounded. Do not use water or gas piping, phone ground or lightning rod.

⚠️ Attention

- Only copper wire can be used. A properly sized breaker should be provided, or electric shock may occur.
- Unit requires 220VAC - 2 voltage wires and a ground. No neutral.
- All indoor units should be wired to the same breaker to prevent some of the units from being powered off while others are energized.
- Controller wiring and refrigerant tubing can be arranged and ran together.
- Disconnect power from both outdoor and indoor units prior to servicing any component in the system.

Supply Wiring Drawing

- Indoor units and outdoor units should be connected to separate power breakers
- Indoor units must share one single electrical breaker. Circuit breaker specifications should be calculated. It is recommended to have both indoor & outdoor units connected to GFCI and surge devices.
Outdoor units are of parallel connection via three lines with polarity. The main unit, central control and all indoor units are of parallel connection via two lines without polarity.

There are three ways of connecting the line control and indoor units:

A. One wired control to control multiple units, i.e. 2-9 indoor units, as shown in the above figure. The indoor unit 3 is the wire controlled main unit and others are the wired controlled sub units. The remote control and the main unit (directly connected to the indoor unit of wired control) are connected via three wires with polarity. Other indoor units and the main unit are connected via three lines with polarity. SW01 on the main unit of wired control is set to 0 while SW01 on other sub units of wired control are set to 1, 2 and so on in turn. (Please refer to the code setting A at page 15)

B. One wired control controls one indoor unit, as shown in the above figure (indoor unit 4-8). The indoor units and the wired control are connected via three lines with polarity.

C. Two wired controls control one indoor unit, as shown in the figure (indoor unit 9). Either of the wired controls can be set to be the master wired control while the other is set to be the auxiliary wired control. The master wired control and indoor units, and the master and auxiliary line controls are connected via three lines with polarity.

Note: For DC motor/low ESP duct type, the PCB comes with the terminal blocks. Please be sure to pay attention to do the wiring according to the labels. The power lines and signal lines go through the metal wire hole separately with the protective sleeve of the connecting line.
Electrical Wiring

Wire gauge size and breaker size for total indoor amp draw. Current NEC guidelines and local codes will trump this chart.

</tr>
</tbody>
</table>

- The electrical power line and signal lines must be tightened.
- Every indoor unit must have a ground connection.
- The power wire should be size up if it exceeds the permissible length.
- Shielding of the wire of all the indoor and outdoor units should be connected together and grounded at one point.
- Signal lines should not exceed 3280 ft (1000 m).

Wired Controller ABC Chart

<table>

</tbody>
</table>

- The shielding lay of the controller wire must be grounded at one end.
- The total length of the controller wire shall not be more than 1968 ft (600 m).
**Dip Switch Setting**

- The dip switch is set to the "On" position if "1" is indicated in the table. The dip switch is set to the "Off" position if "0" is indicated in the table.
- Dip switches set in the factory to on are marked with red.

**Definition principles of code switches:**

(A) Definition of SW01:
SW01_1-4 is used to set indoor address when grouping multiple indoor units connected to single wired controller YR-E16B or YR-E17.

SW01_5-8 set capacity of the indoor unit (factory set). Must only set when replacing board.

(B) Definition and description of SW03
SW03_1-8 is used to set indoor unit address on system. Set address only if using central controller YCZ-A004. Leave default if no central controller is used.

<table>

</tbody>
</table>

Note:
- Set the address by code when connecting the centralized controller or gateway or charge system.
- Address of centralized controller=communication address+0 or+64.
- SW03_2=OFF, address of centralized controller=communication address+0=communication address
- SW03_2=ON, address of centralized controller=communication address+64 (applies when centralized controller is used and there are more than 64 indoor units)

<td>1. ON/OFF, Mode, Fan speed, Temp, Setting, Swing, Energy saving, Clock function, Mode Setting, Screen Saving and Child lock are available. 2. Cancel the filter cleaning icon. 3. Look up the detailed parameter and malfunction code.</td>
</tr>
</tbody>
</table>
Test Run & Fault Code

**Before Test Run**

- Connect it to the power supply of the outdoor units to energize the heating belt of the compressor. To protect the compressor at startup, power it on 12 hours prior to the operation.

**Check if the connections of the drainpipe and wire connection lines are correct.**
The drainpipe shall be placed at the lower part while the connection line placed at the upper part. Insulating measures should be taken such as winding the drainpipe especially on the indoor units with insulating materials. The drain pipe should be installed as a slope to avoid protruding from the upper part and concaving at the lower part.

**Checkup of Installation**
- check if the main voltage is correct
- check for any leaks at the piping joints
- check if the connection of the main power for the indoor & outdoor units are correct
- check if the serial numbers of the terminals are matched properly
- check if the installation place meets the requirement
- check if there is too much noise
- check if the connecting line is fastened
- Check if the refrigerant and condensation lines are insulated
- check if the water is drained to the outside
- check if the indoor units are positioned

**Test Run**

Do ask the installation personnel to make a test run. Take the testing procedures according to the manual and check if the temperature regulator works properly.

When the machine fails to start due to the room temperature, the following procedures can be taken to do the compulsive running. The function is not provided for the type with remote control.

- Set the YR-E17 wired controller to cooling/heating mode, press "ON/OFF" button for 10 seconds to enter into the compulsive cooling/heating mode. Press "ON/OFF" button again to quit the compulsive running and stop the operation of the system.

**Fault Remedies**

When any fault appears, consult the fault code of line control or the number of LED flashes on the control panel of the indoor units/health lamp of receiving window of remote control. Refer to the below table lookup fault descriptions.
